King Joshua Marcos

AI Engineer | LLM Products, Evals & Full Stack (TypeScript, Next.js) | Remote

Pangasinan, Philippines | marcosking1221@gmail.com | +63 929 479 1598 (WhatsApp) | github.com/marcosmodly | portfolio-ebon-pi-34.vercel.app

PROFESSIONAL SUMMARY

AI engineer who builds and ships LLM products end to end, from database schema to production. Founder and sole developer of ModlyAI, a live widget for furniture retailers with chat grounded in each store's catalog and a room planner that matches a shopper's photo and measurements to pieces that fit. Built an evaluation suite for Holdfast that took extraction accuracy from 24/36 to 36/36 by moving date and commitment logic out of the model into tested code. Uses Claude Code daily and publishes Claude Code tooling, including an open source plugin with 42 GitHub stars.

EXPERIENCE

Founder & Developer, ModlyAI (modlyai.tech) | *Remote | Jan 2026 - Present*

- Built an embeddable widget for furniture retailers: chat grounded in each store's catalog, a room planner that matches a shopper's room photo and measurements to pieces that fit and gives each one a position and clearances to all four walls, and a customizer that turns the chosen finish into a quote request.
- Took it from first commit to production on Vercel (Next.js, TypeScript, OpenAI API, InstantDB, Paddle), with a merchant dashboard that imports the catalog from CSV, Shopify, or WooCommerce, on plans from $19 to $199 a month.
- Fixed large catalogs overflowing the model's context: the room planner now retrieves a ranked 60-item shortlist of pieces that are in stock and physically fit the room, and chat sends at most 50 products and tells the model it is seeing a subset.
- Found and removed a silent fallback that served rule-based mock room recommendations whenever the model's echoed id prefix broke catalog matching.
- Put every AI route behind one server-side guard: demo traffic runs on the server's own catalog with daily caps, real stores keep plan limits plus per-minute burst limits, and any catalog sent from the browser is ignored.

PROJECTS

Holdfast (useholdfast.co · github.com/marcosmodly/holdfast) | *Live product. Next.js, TypeScript, Telegram Bot API, OpenAI API | Aug 2026 - Oct 2026*

- Built a Telegram bot that transcribes a short voice note after you meet someone and extracts the person, what is happening in their life, and what was promised, resurfacing it as a reminder on the day it matters.
- Built an evaluation suite of twelve test transcripts run across four prompt versions, three trials each, taking extraction accuracy from 24/36 to 36/36 by moving date resolution, commitment verification, and message copy out of the model and into deterministic code, with 23 unit tests covering date handling.
- Found and fixed a persistence bug where ten of eleven captures silently stored nothing despite the bot reporting success every time, tracing it to a single Instant transaction where one rejected step discarded the person, the facts, and the commitments, and closing the gap between reported and actual success.

Marketing Skill (github.com/marcosmodly/marketing-skill) | *Installable plugin, 42 GitHub stars, 5 forks. Claude Code Agent Skills, Python, Node, ffmpeg | Sep 2026 - Oct 2026*

- Built and published an installable, MIT-licensed Claude Code plugin (also runs in OpenAI Codex) of twelve composable skills for competitor research, content, SEO, ads, cold outreach, and community posting on eleven platforms; first release in four days and 1,241 clones in its first two weeks.
- Designed the approval gate into the shared state file itself: drafting skills can only write Planned, Drafted, or Ready for Approval, and only publish-pipeline can write Approved, in the same turn a person has seen the real content and replied, so nothing sends without a live human reply.
- Built a local video renderer in Node, Playwright, and ffmpeg with 29 templates, a from-scratch music synthesizer, voice-synced word captions, and a QA check that runs on every template in CI, cutting a 12-second render from 76 s to 25 s by rendering frames in parallel.
- Wrote dependency-free Python hand-off scripts that refuse to run without --dry-run or --confirmed and redact credentials in dry-run output, alongside a Gmail-synced suppression list that permanently blocks re-contact after a reply, bounce, or opt-out.

skillsmith (github.com/marcosmodly/skillsmith) | *TypeScript, Node CLI, Claude API, npm package | Aug 2026*

- Built and published an open source CLI that turns a description of desired expertise into a real Claude Skill, running a structured interview, drafting the files, and validating the result against written authoring standards, so the output stays consistent instead of a single unchecked LLM pass.
- Shipped the tool two ways from one codebase, a CLI that calls the Claude API and a native in-product skill that runs with no API key, backed by 19 unit tests and strict TypeScript, and confirmed it with a real npm-pack-and-install round trip.

Second Brain (github.com/marcosmodly/second-brain-ai) | *Next.js, PostgreSQL, pgvector, OpenAI embeddings, JWT auth | Aug 2026*

- Built a personal knowledge base with real semantic search, embedding notes on save and retrieving them by cosine similarity over pgvector, so related notes surface even without shared keywords.
- Built auth (bcrypt + JWT session cookies) and the Postgres schema from scratch instead of a managed auth/DB product, keeping full control over the data model and session security.

Screenshot to Website (github.com/marcosmodly/screenshot-to-website) | *Next.js, TypeScript, Claude vision API, Tailwind | Aug 2026*

- Built a tool that converts a UI screenshot into working, responsive HTML and Tailwind, with a live split-pane preview that re-renders as you edit the code, so changes show up instantly with no build step.
- Verified the sandboxed preview mechanism (iframe srcdoc, script execution) with real headless-browser tests, confirming generated code actually ran safely instead of assuming it worked.

Grandma's Lighthouse | *Godot 4, GDScript | Aug 2026 - Sep 2026*

- Directed Claude Code as the implementer on a five-room puzzle game, and built a breadth-first solver and 19 headless checks that prove every room is solvable and free of soft-locks before it ships.
- Ran external playtests that drove three rounds of difficulty rework based on real player feedback.

TECHNICAL SKILLS

AI & LLM: Claude Code, Claude API, OpenAI API (embeddings, vision), LLM evaluation (prompt eval suites with repeated trials), prompt engineering, RAG and semantic search (pgvector embeddings, catalog retrieval), moving model logic into deterministic code with unit tests
Languages & Frontend: TypeScript, JavaScript, Python, Next.js, React, Tailwind, HTML5, CSS3
Backend & Data: Node.js, PostgreSQL, pgvector, InstantDB, SQL schema design, REST API design, JWT/session auth
Tooling & Deployment: Vercel, Git/GitHub, CI, Playwright, ffmpeg, Telegram Bot API, npm package publishing
Other tools: CAD, Adobe Photoshop, Adobe Premiere Pro

EDUCATION

Coursework toward a B.S. in Architecture | *Pangasinan State University | 2021 - 2025*
Developed precision, structured problem-solving, and systems thinking through technical drafting and digital documentation. Self-taught in full stack web development and AI systems since.

Senior High School, STEM Strand | *ABE International Business College | 2018 - 2020*
Work immersion (2020), Engineering Department, Municipal Government of Urdaneta City: assisted engineers and architects on site inspections and kept technical records.
